

## Executive Summary

Work has been consistent since the Rootbeer Project has been created. Below is a scatter plot showing the number of commits per author, each represented with a different color, which files they changed and when.

The file **RootBeer.java** has had the most changes, **53 total**. This file is a simple root checker to see if a device has been rooted or jailbroken. The author to have the most commits is **Matthew Rollings**, having done **71 commits** spread through 10 source files and updated frequently over the whole lifetime of the project. **Scott Alexander-Bown** is also a prominent worker, having **53 commits** over all the source files.

The authors with the least commits are **Leon Karabchevsky**, **Ali Waseem**, and **Slim Namouchi**. All only total **1 commit** on **RootBeer.java**. While this is only tracking the source files, these employees should be looked at closer for other contributions to the project.

Git commands that I found very useful were *git log* to check any recent commits, *git checkout* to switch to any branches, and *git status* to see the current state of my working tree, tracked files, and staged files.
